

Meet EDM™

Sightline Systems' top-of-the-line, AI-powered data monitoring and analytics solution for advanced IT data intelligence.

REAL-TIME PREDICTIVE ANALYTICS

Live data collection, visualization, monitoring and advanced analytics tools that give you live visibility to streamline operations and improve profitability across your systems.

ADVANCED ANOMALY DETECTION

Establishing and using historical baseline data across ecosystems, configure and build customized alerting algorithms to identify potential issues & their statistical significance as they occur.

ROOT CAUSE ANALYSIS

With live data across the ecosystem, the context of past performance & issues, and drill-down details, our advanced correlation engine resolves issues within minutes –decreasing response time.

CAPACITY PLANNING & FORECASTING

Automate the capacity planning process to create customized reports, alerts, and forecasting, identify resource bottlenecks, predict future capacity constraints and prevent downtime across systems.

The Two Unique Features of EDM: **Clairvor & ForSight**

Two unique features are at the heart of EDM: **Clairvor** and **ForSight**. These unique modules are designed to work together with the Power Agents to provide maximum control to monitor systems, analyze trends and optimize performance.

Feature Spotlight: **Clairvor**

Clairvor is a component of Sightline EDM™ that delivers our capability to provide enterprise-grade root-cause analysis. It automates the investigation of service issues from multiple data sources and integrates all of the necessary information to diagnose issues into one central dashboard.

Key Benefits of **Clairvor**

SAVE TIME

What used to take IT and manufacturing operations teams hours, days, months or years to address, now can be done in a matter of minutes. IT and manufacturing operations teams can quickly and easily gain the insight they need to identify and fix the problem at its cause, not its effect.

SAVE MONEY

Clairvor combines the strength of agent and agent-less data collection together to empower users to find root causes faster, more efficiently and at less cost. Clairvor uses a unique combination of correlation, drill-down and virtualization from multiple sources to perform root-cause analysis so they can reduce expense.

INCREASE ACCURACY

Identifying the right cause within massive, multi-interdependent and global infrastructures can be a nightmare for IT and manufacturing operations teams. Through the power of data and correlation, Clairvor pinpoints problems where they're happening and through the use of EDM, gives IT teams the ability to ensure that fixing one problem won't create another.

Feature Spotlight: ForSight

Sightline ForSight is a component of Sightline EDM that provides the ability to deliver advanced forecasting. ForSight uses highly advanced statistical data models and leverages machine learning to automatically predict future behavior. Users can build data models that describe relationships in the underlying data and tailor the UI for specific needs. This allows users to replace the manual capacity planning process with fully automated capacity forecasts for multiple systems on a defined schedule, and generate a capacity problem report that highlights systems in danger of running out of critical resources. ForSight gives planners the early warning required to proactively manage capacity.

Non-technical users will also find value from ForSight's innate means to generate informative charts, visuals, dashboards as well as advanced analysis using the EDM web interface. The platform is available as a software download and typically runs on premise or is deployed in cloud-based services like AWS or SoftLayer.

Key Benefits of ForSight

PROVIDES AUTOMATED CAPACITY PLANNING

Users can generate automated capacity forecasts for multiple systems on a defined schedule as well as capacity problem reports that highlight systems in danger of running out of critical resources.

DELIVERS ACTIONABLE INTELLIGENCE

ForSight provides projected dates for when systems will run out of capacity. Additionally, through the use of existing connection view technology, users can filter those results to build in-depth drill-down and roll-up views to share with capacity decision makers including executives and systems administrators.

LEVERAGES FORECAST REPORTS

Built to deliver the most insight into a company's current and future capacity needs, ForSight provides an extensive list of out-of-the-box templates supporting operating systems. Default reports include historical data, forecast data and a threshold line that indicates when the capacity limit will be reached. For IT and manufacturing operations professionals with specific capacity needs, custom metrics can be added from any collected data source.
